

Executive Summary

This document first walks through a manual analysis of how to interpret the payload of a TBHH100 temp/humidity sensor, then shows a Helium Console decoder that was developed for the TBHH100.

The manual analysis involved converting the base 64 encoded payload into binary form, then using the information in the TBHH100 Reference Manual to interpret the bits.

The end result of the manual decode was a payload of "CPs3M/////8=" read from the Helium Console debugger interpreted as

- Voltage = 3.6V
- Temp = 73.4F
- Relative Humidity=51%

The decoder development involved finding source code for a device very similar to the TBHH100, then modifying that source code. The Reference table has links to information resources used in the development of this document.

Decoder repository where I found a decoder for a sensor very similar to the TBHH100, healthyhome.js. I modified the healthyhome decoder to work for the TBHH100.

Payload Analysis

This section analyzes the payload returned from the Browan TBHH100 temperature and humidity sensor. From the Helium Console debugger, grab the payload information for data returned by the TBHH100.

```
"payload": "CPs3M/////8=", "payload_size": 8, "port": 103
```

The payload is Base 64 encoded. To interpret, the payload needs to be converted to binary.

CPs3M/////8 This is the payload in Base 64 format
 08fb3733ffffff Payload in Hex format from <https://base64.guru/converter/decode/hex>
 08 fb 37 33 ff ff ff ff

Base64 to Hex

The "Base64 to Hex" converter is a free tool which is able to convert online Base64 strings to Hex values. The conversion process is quite simple: the converter decodes the Base64 into the original data, then encodes it to Hex value and gives you the final result almost instantly. If you are looking for the reverse process, check [Hex to Base64](#).

Base64*

CPa3M/ ////8=

copy clear download

Letters Case

Lowercase (a1b2c3)

▼

Length

For example, specify "128" to get only the first 128 characters of the hex string. Use negative numbers (eg, "-128") to get the last 128 characters

Delimiter

For example, specify a space to get "a1 b2 c3" or specify a comma to get "a1,b2,c3" (by default there is no delimiter, so it returns "a1b2c3")

Decoder Function

```

/*
 * Decoder for the Browan TBHH100 Temperature and Humidity Sensor
 *
 * The starting source code for TBHH100.js came from the file, healthyhome.js found in this repository:
 * https://github.com/SensationalSystems/smart_building_sensors_decoder
 * which was created by Cameron Sharp at Sensational Systems - cameron@sensational.systems
 *
 */

```

```
function Decoder(bytes, port) {

    var params = {
        "bytes": bytes
    };

    // VOC Measurement
        // Disabled on the TBHH100, i.e. is always ffff so comment this section out
    /*
        voc = (bytes[7] << 8) | bytes[6];
    if (voc === 65535) {
        voc_error = true;
    } else {
        voc_error = false;
    }
    */

    // CO2 Measurement
        // Disabled on the TBHH100, i.e. is always ffff so comment this section out
    /*
    co2 = (bytes[5] << 8) | bytes[4];
    if (co2 === 65535) {
        co2_error = true;
    } else {
        co2_error = false;
    }
    */
}
```

```

// Humidity Measurement
rh = bytes[3] & 0x7f;
if (rh === 127) {
    rh_error = true;
} else {
    rh_error = false;
}

// temp measurement (in degrees C)
temp = bytes[2] & 0x7f;
temp = temp - 32;

// Battery measurements
batt = bytes[1] & 0x0f;
batt = (25 + batt) / 10;

//params.voc = voc;
//params.voc_error = voc_error;
//params.co2 = co2;
// params.co2_error = co2_error;
params.rh = rh;
//params.rh_error = rh_error;
params.temp = temp;
params.batt = batt;

return params;
}

```

Helium Console Debug Output

The JSON below is captured from the Console debug output.

Relative Humidity = 61%

Temperature = 28C = 82.4F
